GPS Tracking Options for Fleets!

- Be connected while on the road
- Broadband speeds while moving
- Multiple users simultaneously
- Wireless connection - easy to use
- Permanently mounted or portable
- GPS Tracking (optional)

The WAAV AirBox CM3 cellular router maintains a broadband Internet connection while in a moving vehicle. It is an always-on connection just like cable or DSL, and it functions the same as any home or office wireless network. Users can connect in seconds via Wi-Fi and multiple users can be online at the same time.

The WAAV AirBox CM3 is ruggedized and includes an external antenna for maximum coverage and Internet speed. The router can be mounted permanently or can be moved from vehicle to vehicle.

The optional GPS receiver makes it easy to manage your fleet. A hosted webpage allows you to track your vehicles in real-time. When you visit the page it displays the location of each vehicle on Google Maps™. You can view a single vehicle or your entire fleet at once. Toggle between map and satellite views.

WAAV provides a standard interface for GPS data which allows easy integration into your own custom web page or application with Google Maps™, Google Earth™, or a number of proprietary software solutions.
